## 6. Critical and Frequently Used Commands

### 6.1. Quiesce Test Mode

After programming the Tx defaults to NominalMode (LPP > Digital Ping > Power negotiation > Closed loop). The following command needs to be sent to the Tx to enable QuiesceMode whereby certain test commands are then enabled.

A power cycle will mean the unit needs to be re-programmed as the firmware application is run from SRAM.

This is the test mode whereby additional commands for test/validation are active. This command will disable everything except the MCU i.e. Boost, Bridge, LPP switch will be disabled.

**smokey ScorpiusHid --run --test "Set" --args "ReportID=0x09, ReportPayload={0x01}"**

Resets into the quiesce mode with the bridge disabled.

**Note:** This command i.e. Quiesce Mode needs to be set once at beginning of testing i.e. from [Section 8.1. Load FW](#) or unless unit is reset or power cycled or Nominal Mode has been set. **If the unit is power cycled you will need to load fw again. Nominal Mode**

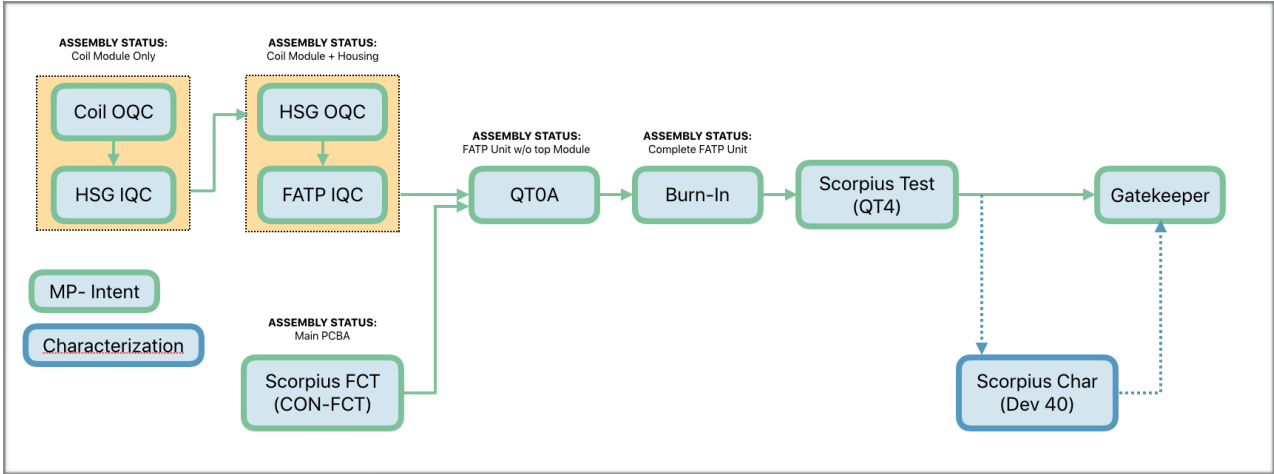

This is the normal runtime mode. Here, a subset of commands used for test/validation are deactivated.

**smokey ScorpiusHid --run --test "Set" --args "ReportID=0x09, ReportPayload={0x00}"**

Resets into the nominal mode where it will start the LPP -> Digital Ping -> Power negotiation -> Closed loop sequence.

7. Overview

The block diagram below shows the overall end-end test coverage for the inductive Scorpius module. This document covers Scorpius Char Station.

7.1. Summary of Test Coverage

Therefore 3 loops of above should finished reading all the LPP data
6	Repeat steps 2 - 5 x 100 times	Fixture & Tx HID	Save all of the data as a single log file for each unit and upload to InSight.
7	Calculate Free Air Δ Tx Frequency & Δ Tx Inductance <small>Averaged over 100 repeats vs MTP sector Value</small>	Tx HID & Fixture	Δ Tx Frequency = SCRP_LPP_FREQ_MTP_BEFORE (From Section 8.3) - <b>Kxx_LPP_Frequency_100_avg</b> Δ Tx Inductance = <b>Kxx_LPP_Inductance_100_avg</b> - SCRP_LPP_L_MTP_BEFORE (From Section 8.3)

### Test Setup and Procedure:

Order of load ramping as follows:

- Adjust bridge phase from 0 - 180 degrees to reach target Vrect at desired load.
- If target Vrect still cannot be achieved with a phase shift of 180 degrees?
- Start increasing VBoost.
- VBoost should only be adjusted when phase = 180 degrees.
- To reach the desired Vrect start ramping the boost voltage.
- To reach the 10C load step the load with 50mA to avoid OVP.

## A. Appendix - B332 Dev Board UART Baud rate

The B332 Dev Board is used to send commands to I2C of Acelues using UART cable. Follow the steps below to open the B332 Dev Board UART.

1. Connect UART (1MByte baudrate, 1.8V) to J89 (Pin9 & Pin 10)
2. Open Terminal
3. `nanocom -w 0 -c 1000000,n,8,1`
4. Select your Connected UART option.

**Note:-**Testing with Ginger Rx board is a backup incase factory is not able to get B332 open loop test up and running on time.
